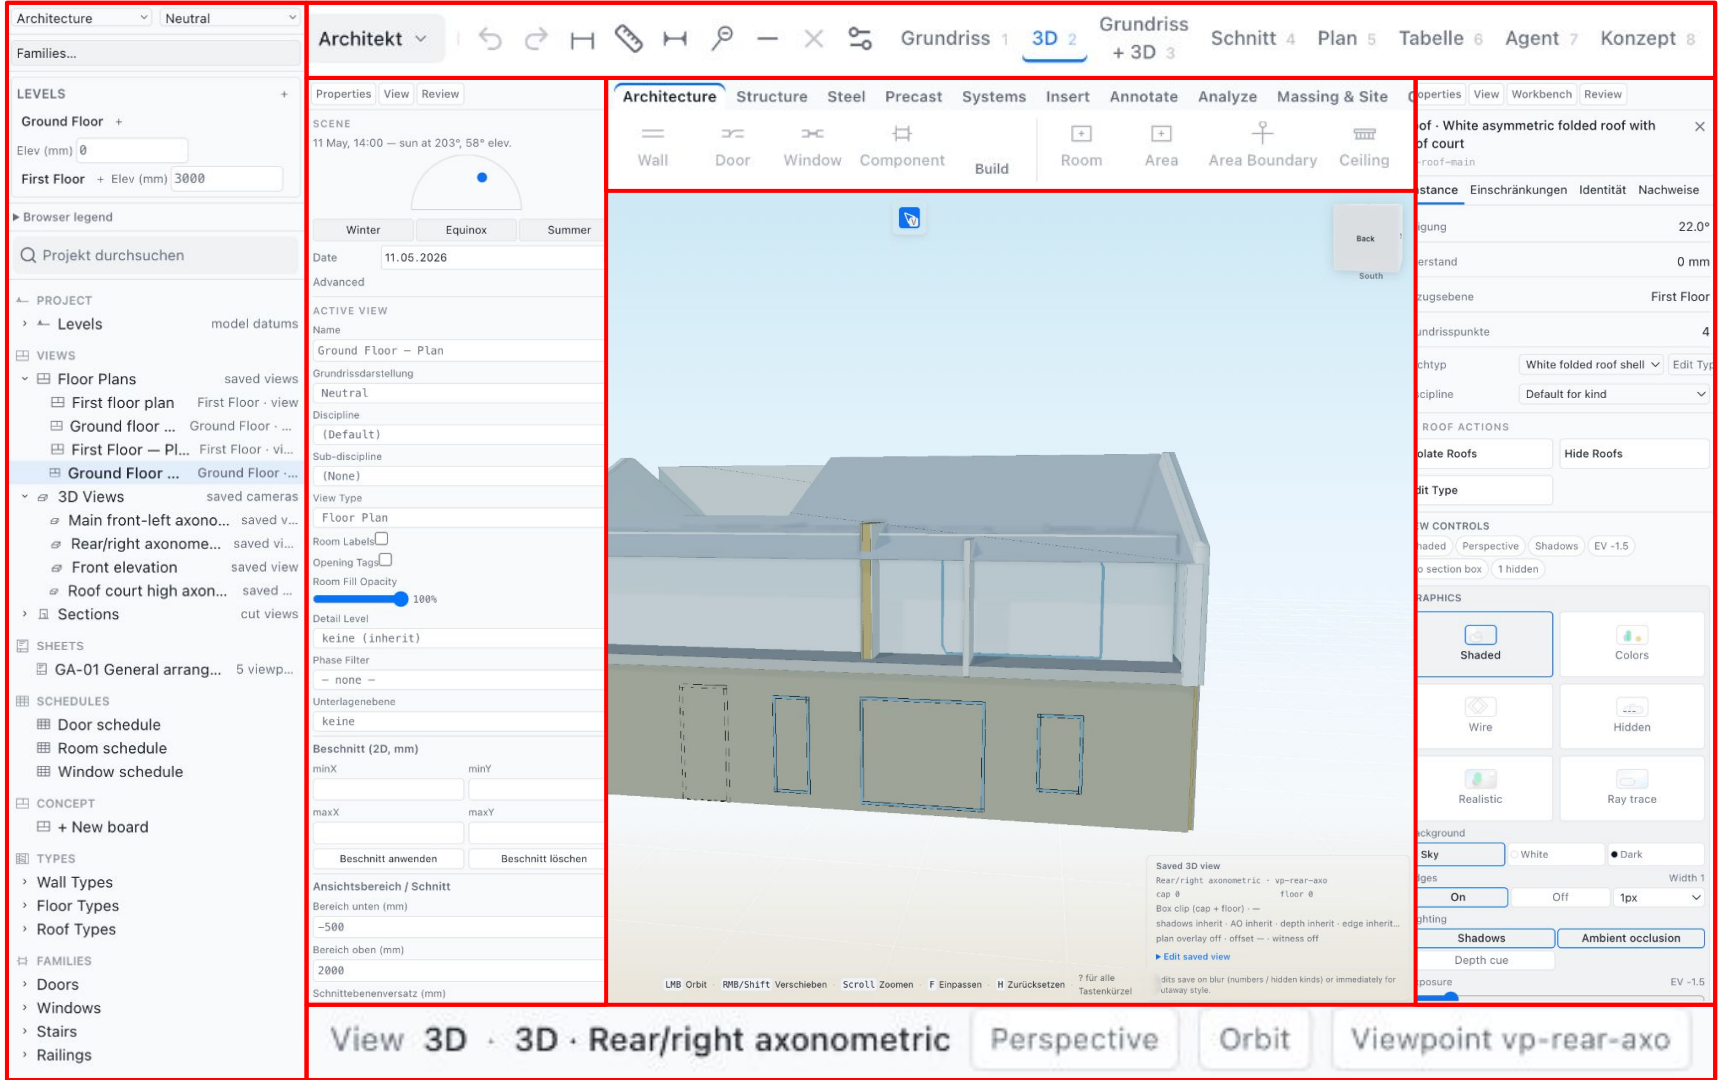
desired look



desired look

required matrix: which features/buttons on which secondary left sidebar, which on element sidebar?

all features should be reachable in the view where they matter; e.g. asset library is relevant in several views, …

header is for tab navigation, footer is for basic information

primary left sidebar is really for navigation (“file-system like of the project”, will now have the project selection as well on top as well as the user menu in the bottom)

secondary left sidebar is for everything relevant in that view type (view = floorplan type, 3d type, sheet, …) - specific to view type!

ribbon for everything around editing in that view type (e.g. placing walls, …) - specific to view type!

element sidebar really is about the selected element (e.g. a very concrete window or such)

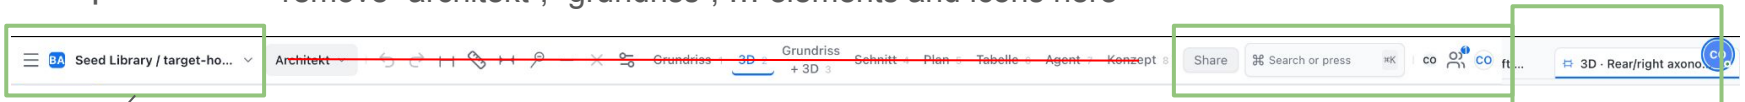
footer for some helpful, footer-classic things

Layout Element Specifics

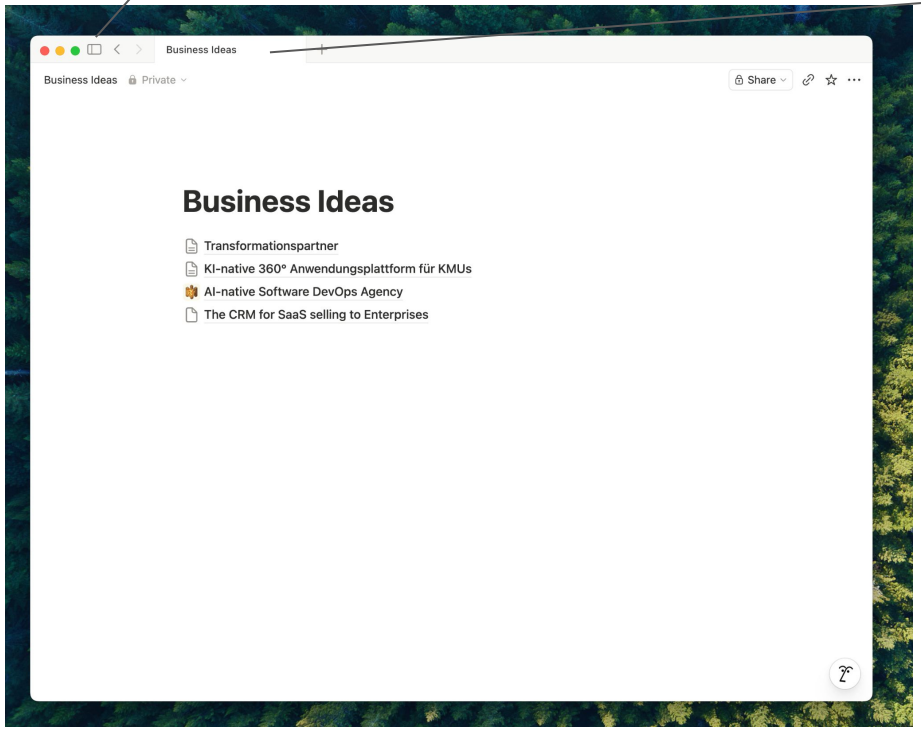
keep

remove “architekt”, “grundriss”, … elements and icons here

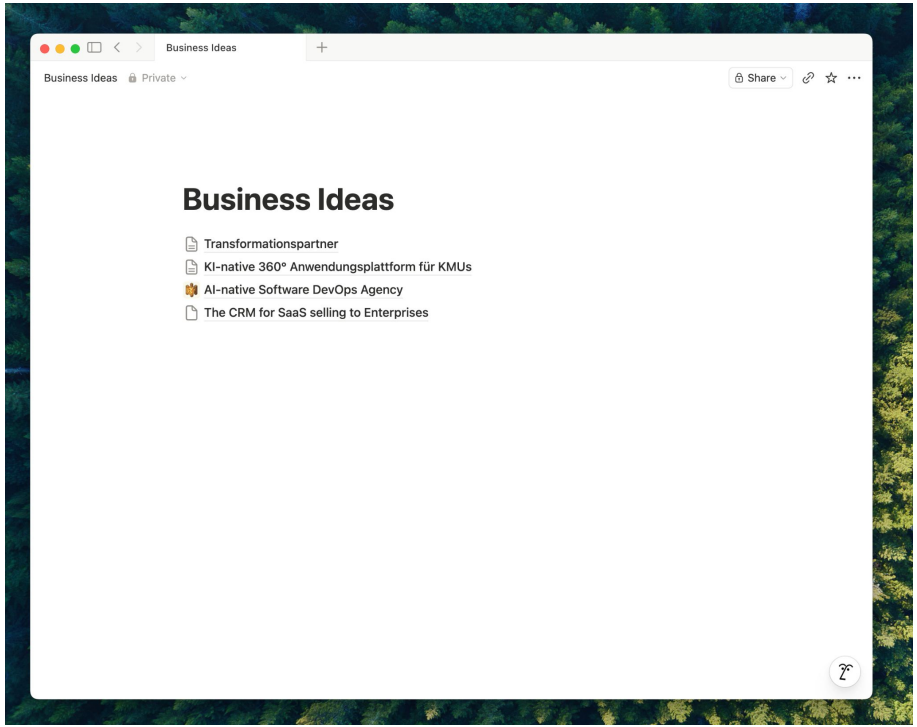
keep, but better structure

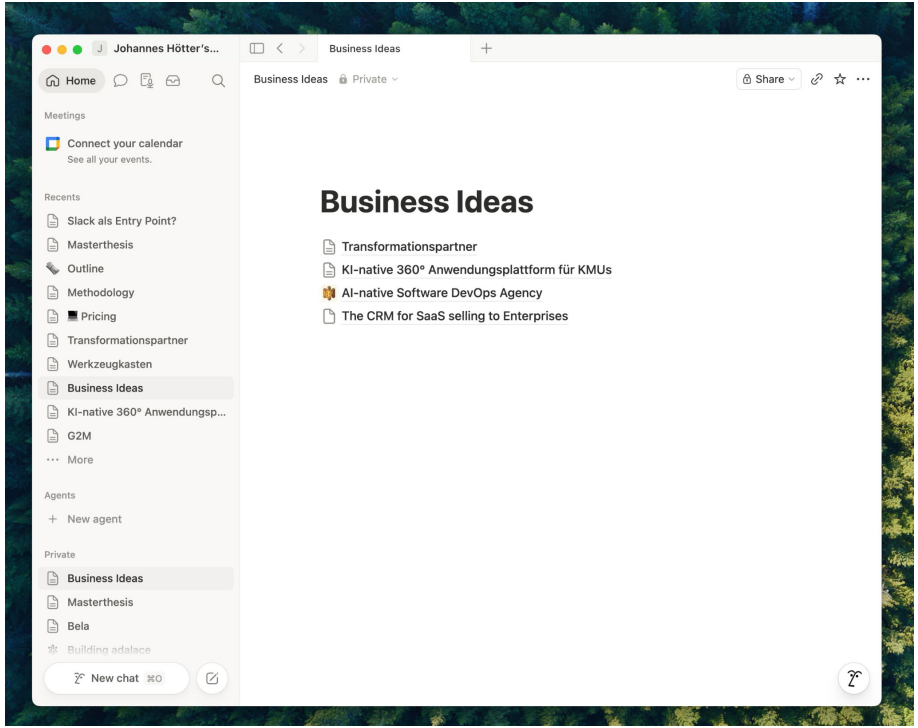


tabs must be core focus of top bar!

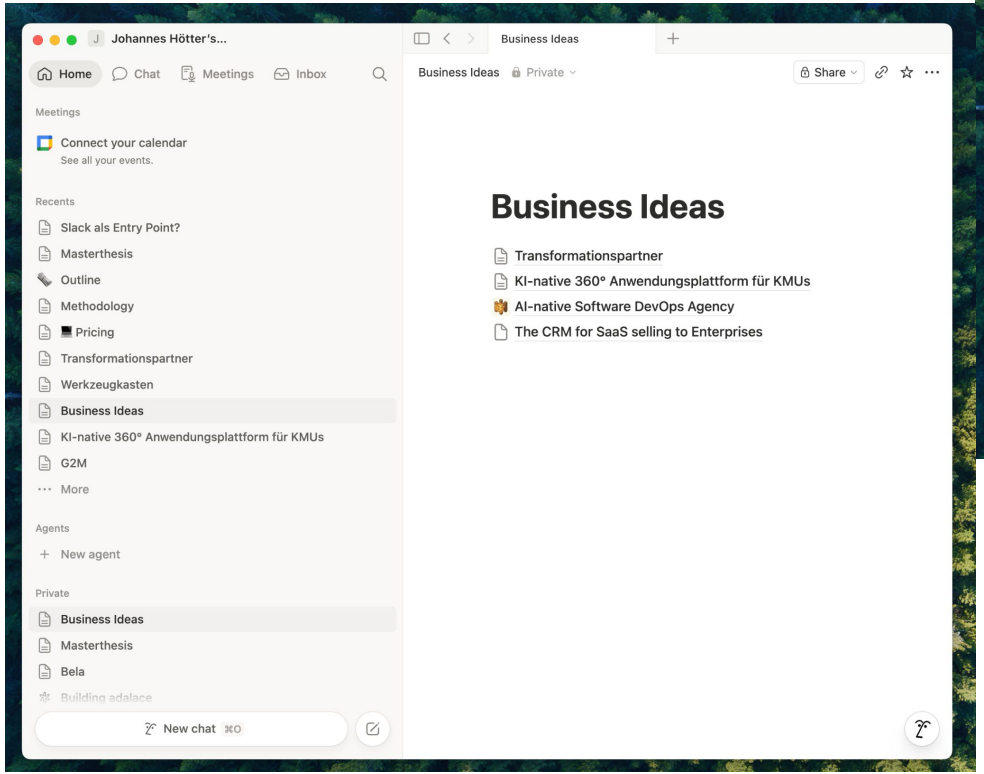


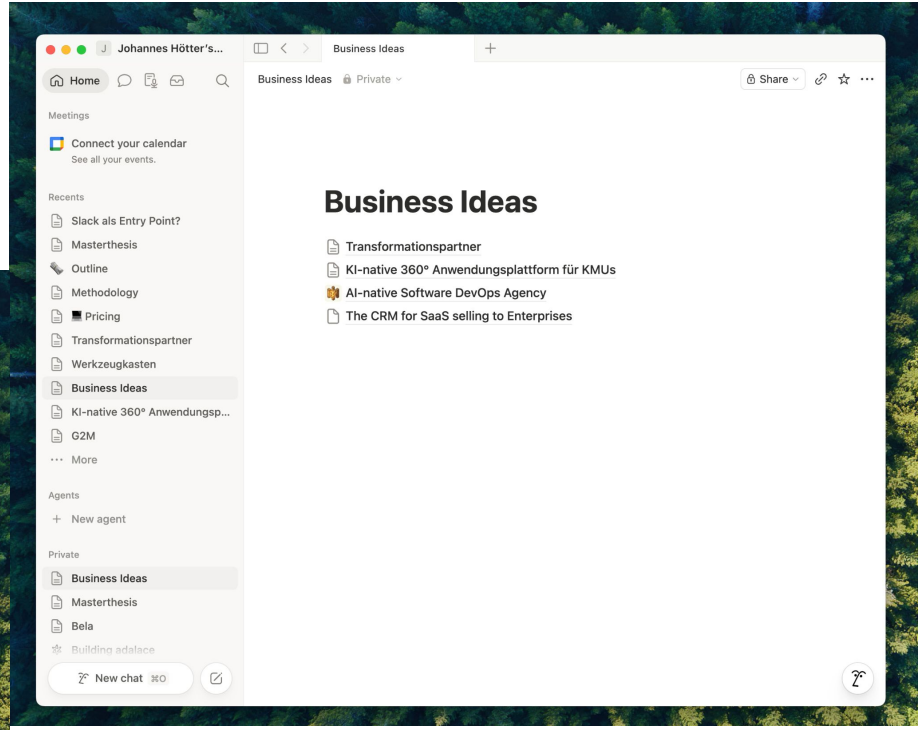
project name and selection becomes part of the primary left sidebar!



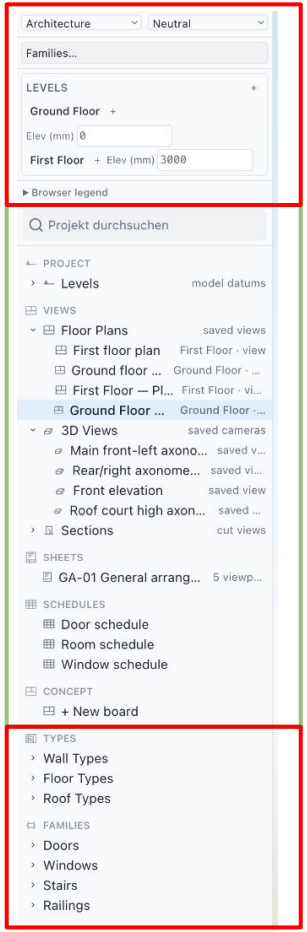


primary left sidebar can be collapsed;
show sidebar icon in topbar if collapsed





sidebar is resizable up to point of being completely hidden (then see as above, sidebar icon needed to show again)



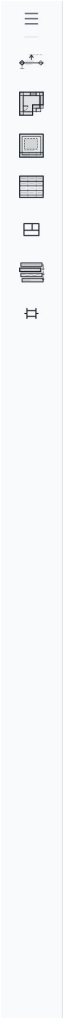
bad pattern; architecture, levels etc is view-specific and shouldnt show in generic primary left sidebar; browser legend is useless

families is super relevant, but not well positioned here

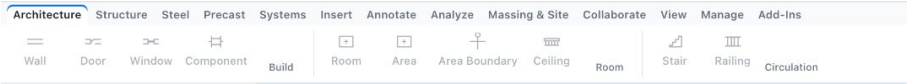
primary left sidebar has same content independent of current view; highlights where user is currently on

should really focus on the navigation!

types and families likely belong somewhere else because no view typea

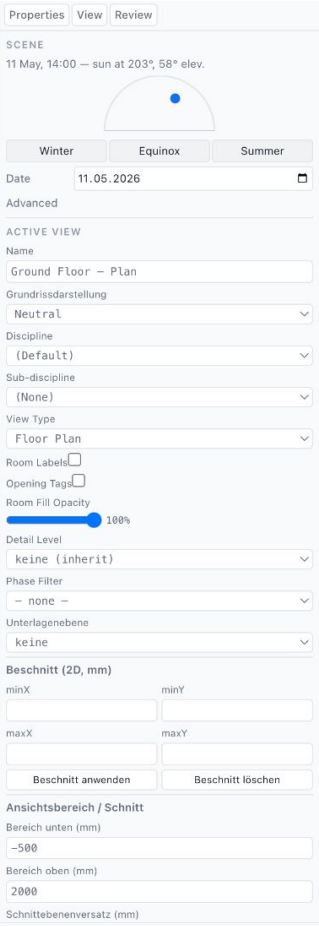


currently collapsed state is useless; clicking on any icon opens the same sidebar, not helpful at all; rather have the hifi icon of the currently active view as an icon in the secondary left sidebar e.g.



ribbon focuses on the editing capabilities of that view type and should be consistent in styling etc across application; ribbon groups help with organizing;

don’t show ribbon groups in a view type where they cant be applied

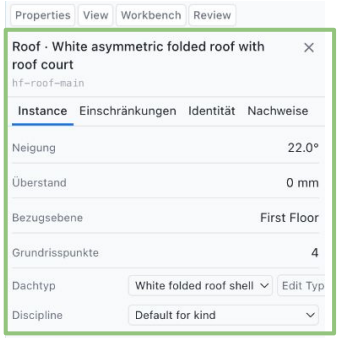


secondary left sidebar is for overall properties and such of that view type; things that are relevant to be displayed for that view (type, e.g. 3d), for all elements

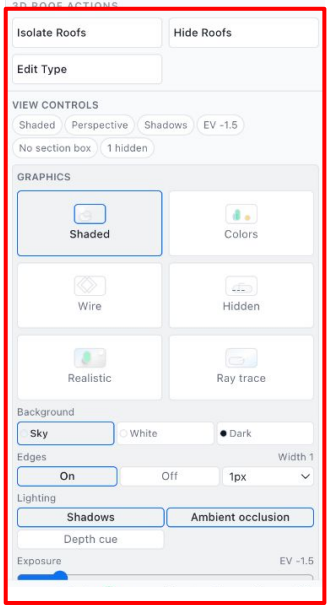
can be resized to a bare minimum, but not fully disappear

element sidebar really is supposed to be about the concrete element **selected**, e.g. a wall;

disappears when no element is selected

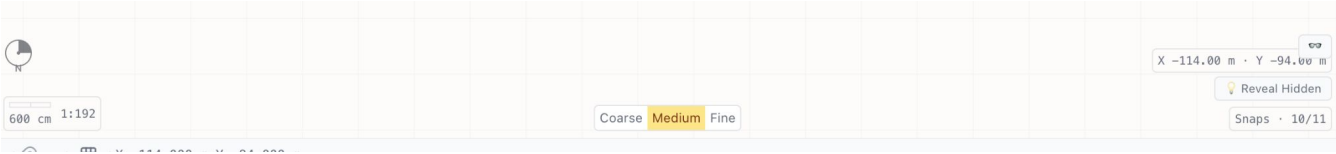


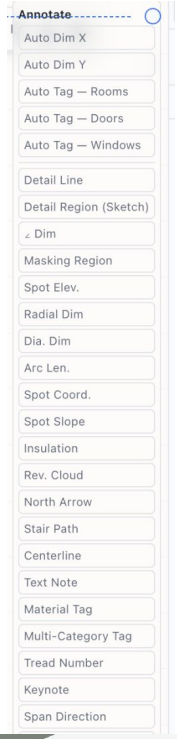
good example

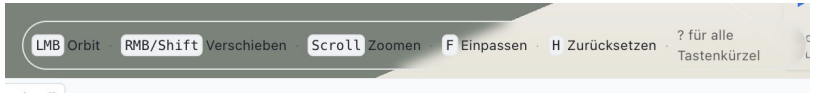


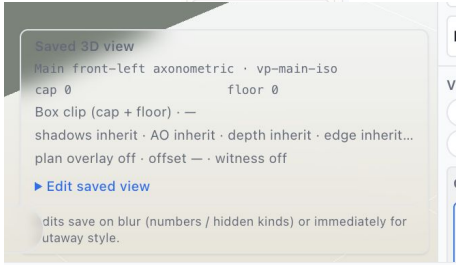
actually for all elements of view type, so should rather be in secondary left sidebar…

many inconsistent layout elements currently..









“berater” (“advisor”)

extremely valuable; put it globally into the footer as a hint how many errors/warnings exist, on click open dialog with all errors, warnings etc!

(currently in some sidebar…)

Overall practices

Don’t take the current status quo grouping / structuring for the best; it has been iterated, but never with real structure. begin by analyzing a feature matrix, where which things should be placed. we want an overall consistent and clear UX.

it should be clear that everything that is visible in the current view type is also usable in the view type; if there is a button showing in floorplan sidebars for instance that is only for 3d renders, that is very bad design! same of course w.r.t ribbons etc.

cmd+k is crucial here is well and should work perfectly, aware of current view type but also allowing navigation and such. same goes for shortcuts. cmd+k is a first-principle UX here, it is so important it works nicely..

steep learning curve is wanted, while allowing that users can go into most powerful modes and settings

what must be visible always (navigation, tabs, global warnings, …), what belongs to specific view types?

how can we ensure a great and consistent look & feel? ribbon expected in each view type, how can we clean up the messy zoo of “docks”, HUDs, etc that we have? ribbon for editing in that view type, secondary left sidebar for properties and such, element sidebar for selected element; think about where elements like asset libraries and such best belong, in what format

dont take current groupings, UI and such as the best way possible; rather think about how the revamp / redesign can achieve an outstanding UX. use the icon set and shared components to achieve great consistency..

don’t lose functionality, and dont have dead buttons. go for simplicity, clarity, and then drilling down where needed. if you need further icon sets, develop them in the bim-icons library.
